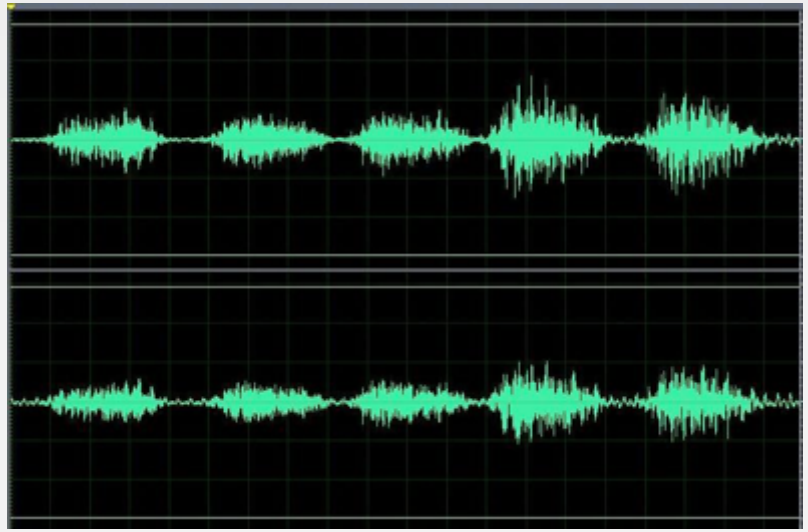
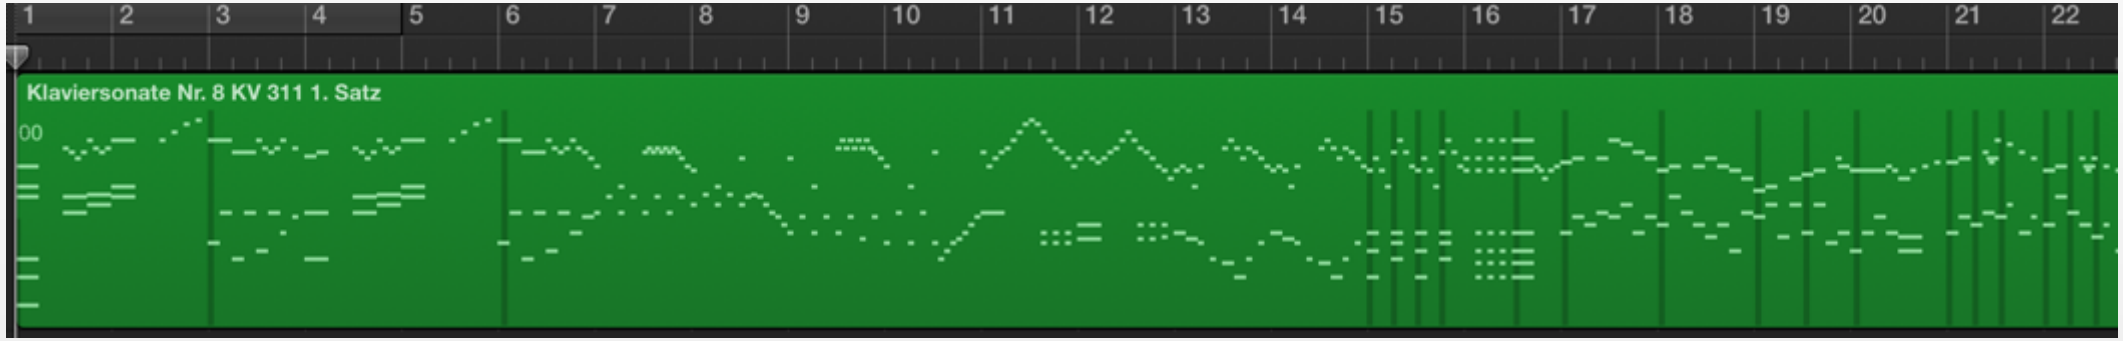
我们生活在一个序列的世界



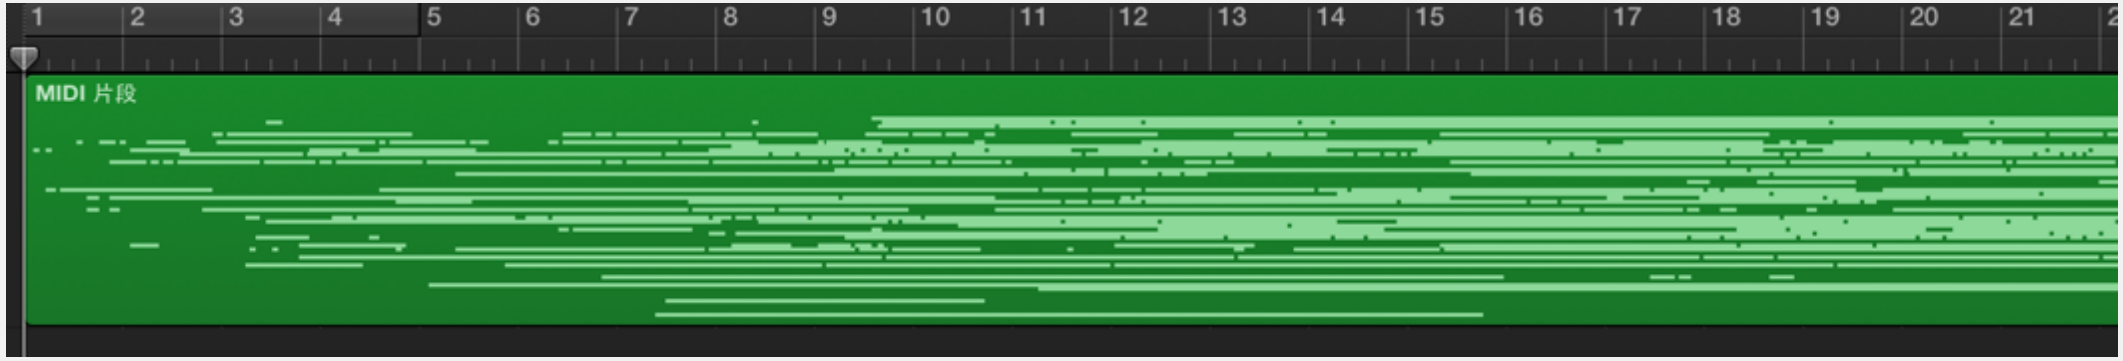
序列生成问题

- A yellow bus driving down a road with green trees and green grass in the background.

神经网络莫扎特



用莫扎特的原曲作为训练数据，让RNN学习其中的Pattern，然后再让它重新创造一段曲子



序列生成问题通用解决方法

基本思想

1. 将生成问题转化成一个预测问题;
2. 完成自举过程：给定一个种子，不断用已经生成的数据预测下一个数据

序列生成问题通用解决方法：第一步

我爱北京天安？ ⟶ 门

序列生成问题通用解决方法：第一步

我爱北京天安? → 门

$W_1, W_2, W_3, \ldots$  W_n

序列生成问题通用解决方法：第二步

w_1, w_2, w_3 →  → w_4

w_1, w_2, w_3, w_3, w_4

序列生成问题通用解决方法：第二步

w_1, w_2, w_3, w_4 →  → w_5

$w_1, w_2, w_3, w_3, w_4, w_5$

序列生成问题通用解决方法：第二步

w_1, w_2, w_3, w_4, w_5 →  → w_6

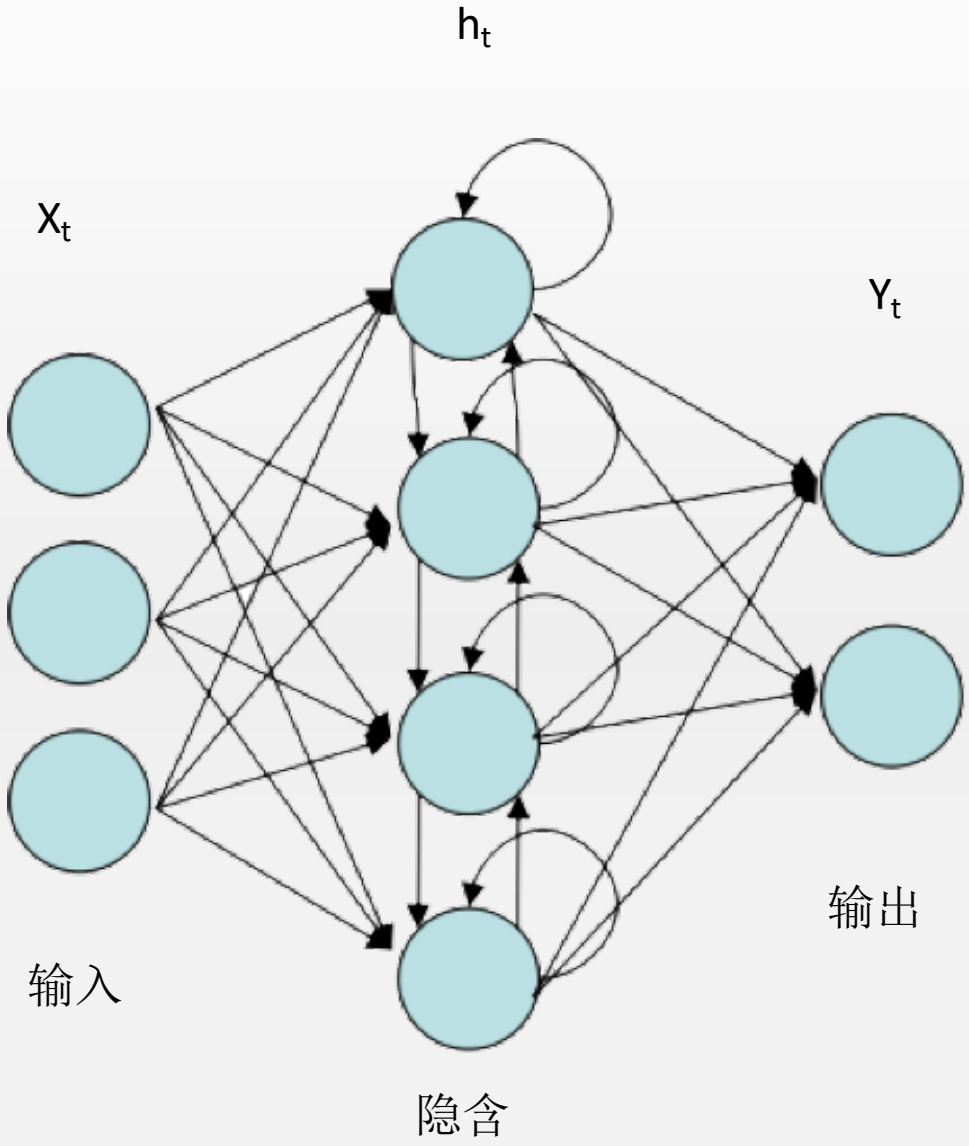
$w_1, w_2, w_3, w_3, w_4, w_5, w_6$

RNN

- 隐含层内部存在着连接
- 每一个隐含层单元都与所有其他隐含层单元相连接

$$h_t = \sigma(W_{Xh}X_t + W_{hh}h_{t-1})$$

$$Y_t = \sigma(W_{hY}h_t)$$



上下文无关语法生成器

让RNN学会一定的语法：

01
0011
0000011111
000111
01
000111
0000000001111111111

训练数据

0^n1^n

为什么要研究这样的语法？

- 它足够简单
- 自然序列中存在着类似的Pattern
  - The evidence was convincing(nv)
  - The evidence the lawyer provided was convincing(nnvv)
  - The evidence the lawyer the gangster retained provided was convincing(nnnvvv)
- 学术价值

问题的关键点和难度

- 问题的关键点在第一个1出现之后
  - 000001……
  - 后续的1必然要与前面的0的个数相匹配
- RNN必须自己学会计数
  - n没有显示地表达在输入数字中

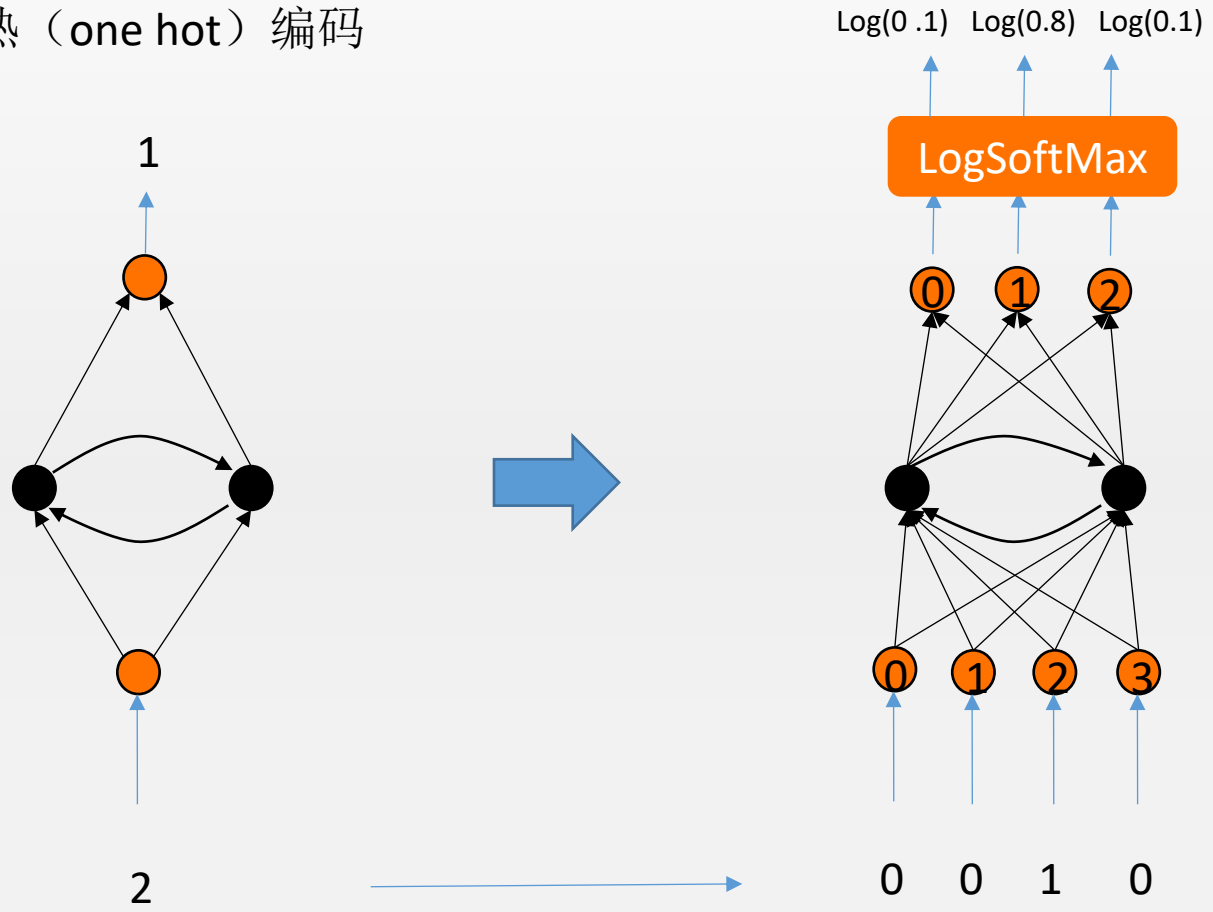
真正的神经网络

输出：0，1，2三种可能

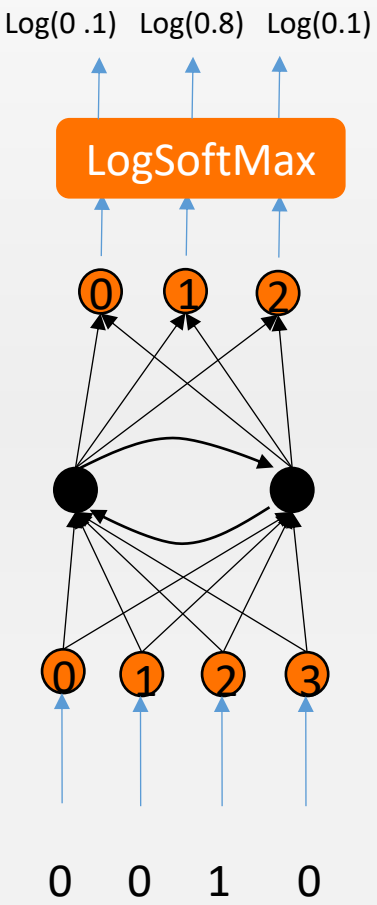
需要将类型变量变成独热（one hot）编码



输入：0，1，2，3四种可能

损失函数

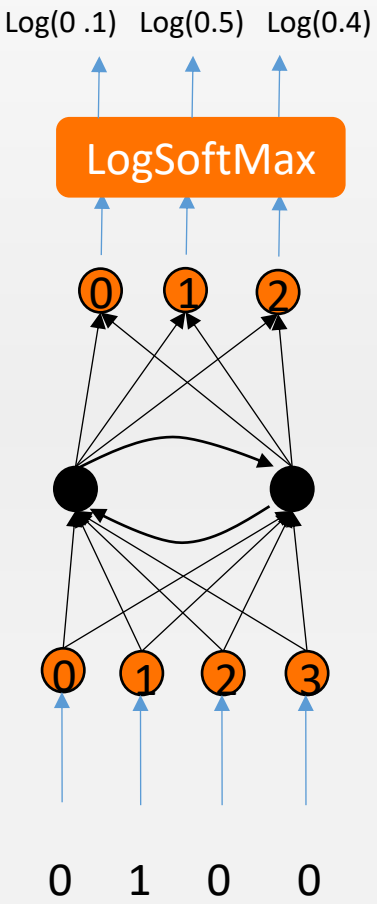
标准答案: 1



$$L_{t=0} = -\log p_1 = -\log(0.8)$$

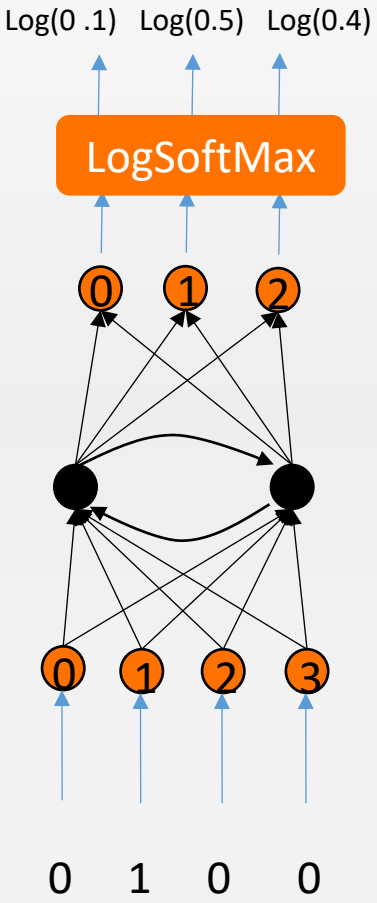
损失函数

标准答案: 0



$$L_{t=1} = -\log p_0 = -\log(0.1)$$

损失函数



假设序列总长度为T，则：

$$L_{总} = -(\log p_0 + \log p_1 + \log p_2 + \cdots \log p_T)$$

测试效果

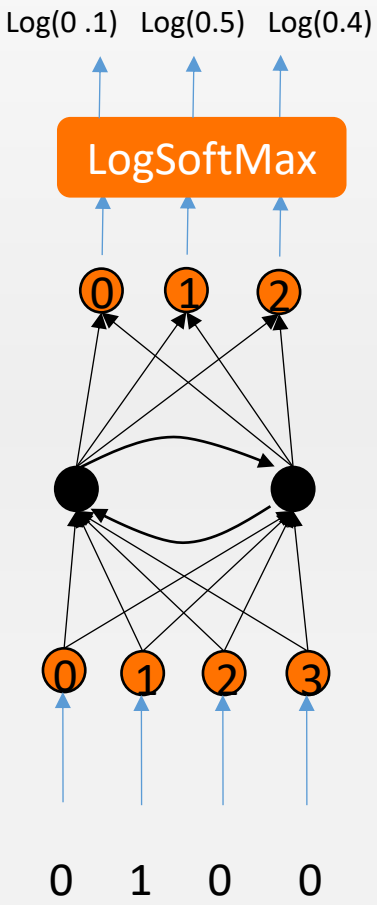
RNN的PyTorch实现



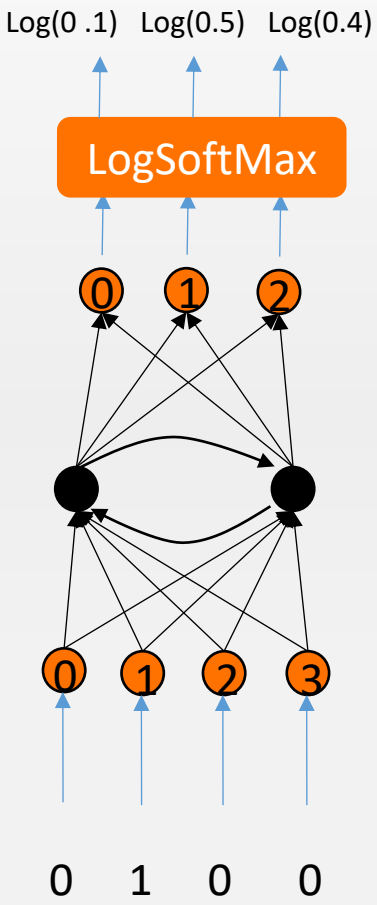
```python
class SimpleRNN(nn.Module):
    def __init__(self, input_size, hidden_size, output_size, num_layers = 1):
        super(SimpleRNN, self).__init__()

        self.hidden_size = hidden_size
        self.num_layers = num_layers
        # 一个embedding层
        self.embedding = nn.Embedding(input_size, hidden_size)
        # 隐含层内部的相互链接
        self.rnn = nn.RNN(hidden_size, hidden_size, num_layers, batch_first = True)
        # 输出的全链接层
        self.fc = nn.Linear(hidden_size, output_size)
        # 最后的logsoftmax层
        self.softmax = nn.LogSoftmax()

    def forward(self, input, hidden):

        # 先进行embedding层的计算，它可以把一个
        x = self.embedding(input)
        # 从输入到隐含层的计算
        output, hidden = self.rnn(x, hidden)
        # 从输出output中取出最后一个时间步的数值
        output = output[:,-1,:]
        # 喂入最后一层全链接网络
        output = self.fc(output)
        # softmax函数
        output = self.softmax(output)
        return output, hidden
```

RNN函数的坑



self.rnn = nn.RNN(hidden_size, hidden_size, num_layers, **batch_first** = **True**)

output, hidden = self.rnn(x, hidden)

- x: batch_size * time_step * input_size
- hidden : num_layers * batch_size * hidden_size
- output: time_step * batch_size * hidden_size

例子：

>>> **rnn** = nn.**RNN**(10, 20, 2) ： 输入单元10，隐含单元20，2层
>>> input = Variable(torch.randn(5, 3, 10))： 5个时间步，batch_size =3, 10维的输入向量
>>> h0 = Variable(torch.randn(2, 3, 20)) ： 2层，batch：3，隐含单元20
>>> output, hn = **rnn**(input, h0)： output为一个5*3*20的张量

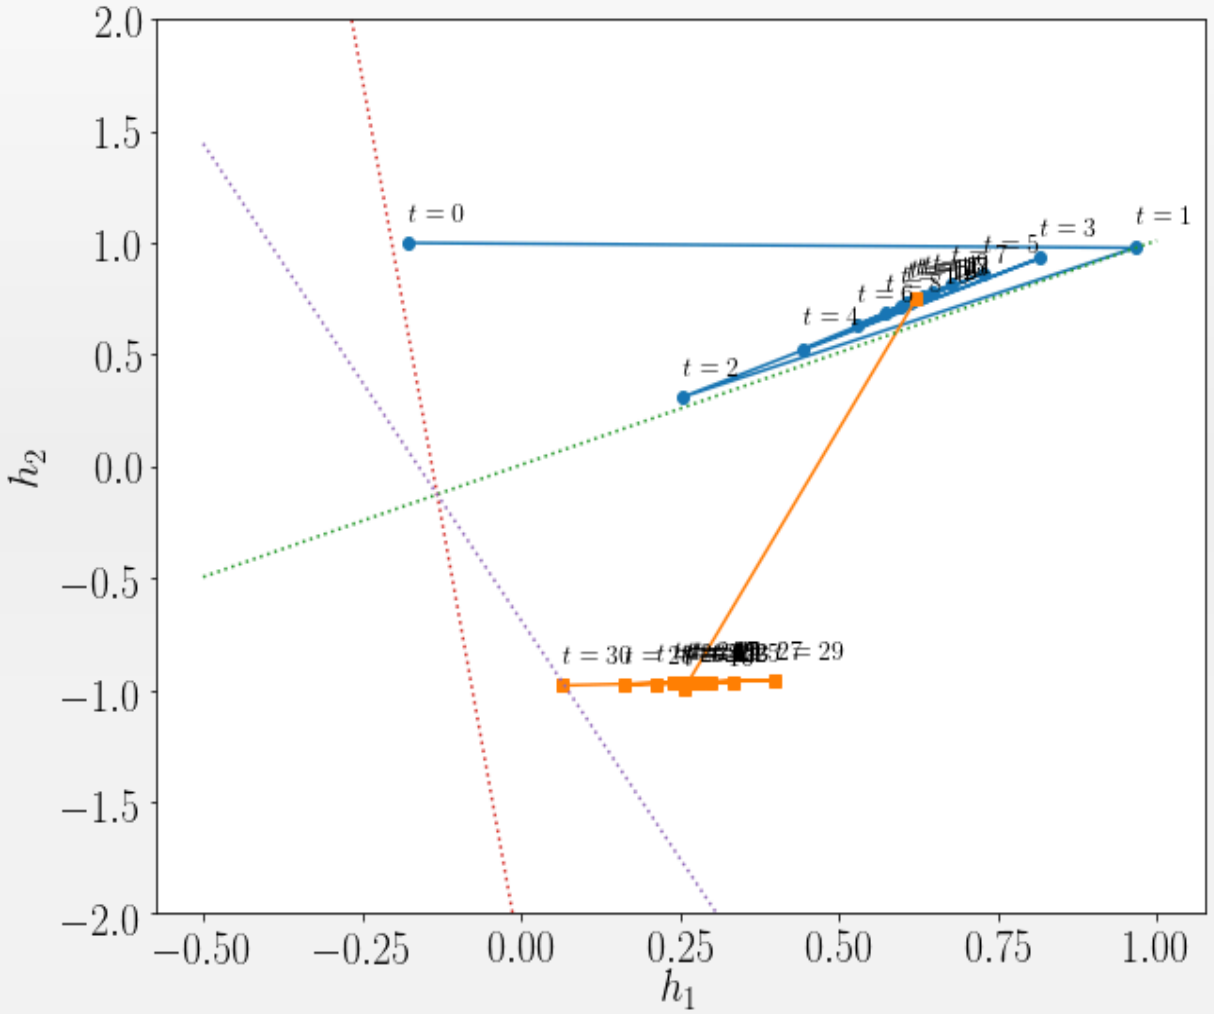
事实上……



RNN实现了两个动力系统:

$$h_{t+1} = f(h_t) = RNN(0, h_t)$$

$$h_{t+1} = g(h_t) = RNN(1, h_t)$$

这两个动力系统要求:

- f和g的不动点要能被绿色线分开
- 运动的直线为系统的特征向量方向
- f与g的特征值应该互为倒数

基本步骤

MIDI音乐与MIDO

- 乐器数字接口(Musical Instrument Digital Interface,MIDI) 是20 世纪80 年代初为解决电声乐器之间的通信问题而提出的。MIDI 传输的不是声音信号,而是音符、控制参数等指令, 它指示MIDI 设备要做什么,怎么做, 如演奏哪个音符、多大音量等。
- MIDO是一个非常方便好用的Python包，可以直接读入midi音乐，也可以输出midi音乐

- 关键的数据结构是一个Message列表：
- [msg1, msg2, msg3,…]
- 每个msg包括：
  - **音符（note~[24,102]）**
  - **强度（速度[0,128]）**
  - **与相对上一个音符的时间（time[0,1]）**
